Santana Kenner

AI Operations and Automation: AI agents, workflow automation, real-time reporting

New York, NY · santana@igotittoo.org · Portfolio · GitHub · LinkedIn · Invoice Checker demo

SUMMARY

I build AI agents and plain, rule-based code that move information between the people doing the work, so purchasing, logistics, accounting, and the field see the same truth in real time. AI reads the messy documents, emails, and PDFs, and rules make the decisions, so every result can be audited. My operations background includes supporting 45,000+ healthcare employees, forecasting contact-center staffing, and coordinating field service and vendors. I start by watching what slows a team down, then build the smallest tool that removes it.

FEATURED PROJECT

Invoice Checker: AI-assisted three-way match for contractor invoices · Python, Claude API, Pydantic, Jira · demo — Nov 2026

- Built a pipeline that checks supplier invoices against purchase orders and delivery tickets, then sends each problem to Purchasing, Logistics, or Accounting.
- Used Claude to read vendor PDFs in any layout into structured data, with a strict copy-as-printed rule so vendor errors are caught, not silently fixed.
- Wrote rule-based checks for price, quantity ordered, quantity delivered, math, and duplicates, so every decision is repeatable and auditable.
- On 5 sample invoices, approved 1 and held 4, catching $8,887 in overcharges, undelivered material, a math error, and a duplicate payment.
- Files each held invoice as a Jira ticket in its team's queue through the Jira REST API, with no duplicates on re-runs.

EXPERIENCE

NYC Health + Hospitals · *Automation Engineer, Virtual Agent Services* — June 2025 – present

- Built a real-time queue alert for a NICE CXone contact center: the Studio routing script posts each waiting call to Webex by webhook, with 5-minute reminders, no extra servers, and failsafe branching so a Webex outage can't drop a call.
- Chose an event-driven webhook over API polling to avoid rate limits and NICE's upcoming authentication API retirement.
- Building a scheduled Studio script that alerts Webex within 30 seconds when an agent refuses a call, with no repeat alerts.
- Built an agent-style monitor that watches service deadlines and alerts the right support team in Webex before a ticket misses its SLA.
- Replaced manual daily reporting by automating collection of tickets, interactions, and work orders from ServiceNow dashboards, so leaders get the numbers without anyone copying them by hand.

NYC Health + Hospitals · *Systems Analyst* — Jan 2016 – June 2025

- Supported 45,000+ employees across NYC Health + Hospitals, learning where workflows break by working directly with the people using them.
- Built automated reporting and call volume workflows that replaced manual spreadsheet work, and a user verification app that cut support ticket click-through in half.

Freelance · *AI-assisted research and automation* — 2026

- Researched HR and payroll buyers at 29 accounts for a sales-prospecting client, then used Google Antigravity as an independent AI auditor to recheck 5 workbooks against the sourcing rules and the live web, finding 2 critical errors and 10 inconsistencies that I fixed and logged.

iGotITtoo.org · *Co-founder (part-time)* — ongoing

- Secured $250,000+ in Google grants for tech education in under-served communities.

MORE PROJECTS

- **No Heat NYC** · Python, GitHub Actions: a live site rebuilt every morning from four NYC Open Data datasets and the National Weather Service, with pages for 11,000–40,000 buildings, a daily health check, and Bluesky alerts.
- **Do I Move My Car?** · Python, NYC 311 API: an hourly-updated answer on whether alternate side parking is in effect, with street-cleaning times for about 3,800 streets and alerts when the rules are suspended.

SKILLS

- **AI and agents:** Claude API, Claude Code, Google Gemini, Google Antigravity, structured extraction from PDFs, multi-model output checks
- **Automation and integration:** Python, pandas, REST APIs, webhooks, Selenium, ServiceNow, Jira (REST API automation), scheduled jobs (GitHub Actions)
- **Data and reporting:** SQL, PostgreSQL, Excel automation (openpyxl), CSV and JSON pipelines, dashboards

EDUCATION AND TRAINING

- **Manifold, a program of The Multiverse School** (2026 – present): Production Agent Engineering; Agentic SDLC: Ship Software with AI Agent Teams; Intro to Agents; Context Engineering; Control AI Spending
- **University of Pittsburgh:** Electrical Engineering coursework toward a B.S. · **Utica University:** Cybersecurity and Information Assurance coursework toward a B.S. · **Queensborough Community College:** Software Development continuing education
